Abstract of JP61192309

PURPOSE: To make it possible to simply and efficiently remove a contaminant such as colloid, by embedding air sending pipes opanad at both ends in hollow yarn bundles in a dispersed state so as to pierce through the lowar adhered and fixed part of a hollow yarn type module. CONSTITUTION: Hollow yarn bundles comprising hollow yarns 2 each openad at the uppar end thareof and closed at the lower end thereof are received in a housing 1 and a large number of air sending pipas 5 longar than a lowar adharad and fixed part 3 and opened at both ands the reof are embadded in the hollow yarn bundles in a disparsad state so as to pierce through the lower adhered and fixed part 3. When the filtering afficiancy of each hollow varn is lowered by the adhesion of colloid to the outer wall of the hollow yarn during the filtering of raw watar, tha supply of raw watar is stopped and gas or a gas-containing liquid is sent into tha hollow yams through the air sending pipes 5 and a contaminant such as colloid is released from the wall of each hollow yarn by sant-in gas to rastora the activity of the hollow yam. Because hollow yarns hold sufficient intervals by the isolation pipes 4 in an upper adhared and fixed part 3, the sent-in gas uniformly risas through the hollow yarn bundlas to anhance removal capacity.
